

Amendments to the Specification

Please replace paragraphs [0050] – [0055] with the following amended paragraphs:

[0050] Figures 15A-D ~~14A-B~~ are top and sectional views of another embodiment of a conductive article;

[0051] Figures 16-18 ~~15-17~~ are a sectional view of alternate embodiments of a conductive article;

[0052] Figure 19 ~~18~~ is sectional view of another embodiment of a conductive article having one embodiment of a ball assembly; and

[0053] Figures 20A-B ~~19A-B~~ are side and exploded views of the ball assembly of Figure 19 ~~18~~;

[0054] Figure 21 ~~20~~ is one embodiment of a contact element of the ball assembly of Figures 19 and 20A-B; ~~18 and 19A-B~~;

[0055] Figures 22-24 ~~21-23~~ are perspective and sectional views of another embodiment of a conductive article having another embodiment of a ball assembly; and

Please replace paragraph [0210] with the following amended paragraph:

[0210] In the embodiment depicted in Figure 15B ~~14B~~, the conductive rollers 1506 are a plurality of balls disposed in one or more conductive carriers 1520. Each conductive carrier 1520 is disposed in a slot 1508 formed in the polishing surface 1502 of the conductive article 1500. The conductive rollers 1506 generally extend from the polishing surface 1502 and are configured to provide electrical contact with the metal surface of the substrate being polished. The conductive rollers 1506 may be formed from any conductive material, or formed from a core 1522 at least partially coated with

a conductive covering 1524. In the embodiment depicted in Figure 15B 44B, the conductive rollers 1506 have a polymer core 1522 at least partially covered by a soft conductive material 1524. An example is a TORLON™ polymer core coated with conductive gold layer using copper as seeding layer between TORLON™ and gold layer. Another example is TORLON™ or other polymer core coated with a layer of copper or other conductive material. Other soft conductive materials 1524 include, but are not limited to, silver, copper, tin and the like.

Please replace paragraphs [0214] – [0215] with the following amended paragraphs:

[0214] In the embodiment depicted in Figure 15B 44B, a resilient member 1510 may be disposed in the respective slots 1508 between the conductive carriers 1520 and the conductive portion 1504. The resilient member 1510 allows the conductive rollers 1506 (and carrier 1520) to move relative to the conductive portion 1504, thereby providing enhanced compliance to the substrate for more uniform electrical contact during polishing.

[0215] In the embodiment depicted in Figure 15C 44C, the conductive rollers 1506 are respectively disposed in a plurality of electrically insulative housings 1530 that are coupled to the disc 206. Each housing 1530 may be coupled to the disc 206 by welding, adhesives, staking or other methods. In the embodiment depicted in Figure 7C, the housings 1530 are threaded into the disc 206.

Please replace paragraph [0221] with the following amended paragraph:

[0221] In the embodiment depicted in Figure 15C 44C, the pad assembly 1540 includes a dielectric layer 1550, a subpad 1552 and an electrode 1554. The dielectric layer 1550, the subpad 1552 and the electrode 1554 may be coupled together as a replaceable unit, for example by compression molding, staking, fastening, adhering, bonding or by other coupling methods.

Please replace paragraphs [0223] – [0224] with the following amended paragraphs:

[0223] A second set of apertures 1544 (one of which is shown in Figure 15C 44C) may be formed at least through the dielectric layer 1550 through at least the dielectric layer 1550 and the subpad 1552 to allow electrolyte disposed on the pad assembly 1540 to provide a current path between the electrode 1554 and the substrate 114. Optionally, the apertures 1544 may extend into or through the electrode 1554. A window (not shown) may also be formed in the pad assembly 1540 as described above with reference to Figure 7F to facilitate process control.

[0224] In the embodiment depicted in Figure 15D 44D, a pad assembly 1560 includes at least a conductive layer 1562, a subpad 1564 and an electrode 1554. The conductive layer 1562, the subpad 1564 and the electrode 1554 may be coupled together as a replaceable unit. The pad assembly 1560 may include first apertures 1570 configured to accept the housing 1530 and second apertures 1572 to allow electrolyte disposed on the pad assembly 1560 to establish a current path between the substrate 114 and the electrode 1554. A window (not shown) may also be formed in the pad assembly 1560 as described above.

Please replace paragraph [0228] with the following amended paragraph:

[0228] Figure 16 45 is a sectional view of another embodiment of a conductive article 1600. The conductive article 1600 generally includes a conductive portion 1602 adapted to contact a substrate during polishing, an article support portion 1604 and an interposed pad 1606 sandwiched between the conductive portion 1602 and the article support portion 1604. The conductive portion 1602 and article support portion 1604 may be configured similar to any of the embodiments described herein or their equivalent. A layer of adhesive 1608 may be provided on each side of the interposed pad 1606 to couple the interposed pad 1606 to the article support portion 1604 and the conductive portion 1602. The conductive portion 1602, the article support portion 1604 and the interposed pad 1606 may be coupled by alternative methods thereby allowing

the components of the conductive article 1600 to be easily replaced as a single unit after its service life, simplifying replacement, inventory and order management of the conductive article 1600.

Please replace paragraphs [0234] – [0235] with the following amended paragraphs:

[0234] Figure 17 46 is a sectional view of another embodiment of a conductive article 1700. The conductive article 1700 generally includes a conductive portion 1602 adapted to contact a substrate during polishing, a conductive backing 1610, an article support portion 1604 and an interposed pad 1706 sandwiched between the conductive portion 1602 and the article support portion 1604, having similar construction to the conductive article 1600 described above.

[0235] In the embodiment depicted in Figure 17 46, the interposed pad 1706 is fabricated from a material having a plurality of cells 1708. The cells 1708 are generally filled with air or other fluid, and provide a resiliency and compliance that enhances processing. The cells may be open or closed with a size ranging from 0.1 micron meter to several millimeters such as between 1 micron meter to 1 millimeter. The invention contemplates other sizes applicable for interposed pad 1706. The interposed pad 1706 may be at least one of permeable or perforated to allow electrolyte to flow therethrough.

Please replace paragraph [0237] with the following amended paragraph:

[0237] Figure 18 47 is sectional view of another embodiment of a conductive article 1800. The conductive article 1800 includes a conductive portion 1802 coupled to an article support portion 1804. Optionally, the conductive article 1800 may include an interposed pad and conductive backing (both not shown) disposed between the conductive portion 1802 and the article support portion 1804.

Please replace paragraph [0244] with the following amended paragraph:

[0244] Figure 19 48 is a partial sectional view of another embodiment of an ECMP station 1990 and Figures 20A-B 49A-B are side and exploded views of a ball assembly 1900 of the ECMP station 1990 of Figure 19 48. The ECMP station 1990 includes a platen 1950 that supports a polishing pad assembly 1960 on which a substrate 114 retained in a polishing head 130 is processed. The platen 1950 includes at least one ball assembly 1900 projecting therefrom and coupled to a power source 1972 that are adapted to bias a surface of the substrate 114 during processing. Although two ball assemblies 1900 are shown in Figure 19 48, any number of ball assemblies may be utilized and may be distributed in any number of configurations relative to the centerline of the platen 1950.

Please replace paragraphs [0249] – [0250] with the following amended paragraphs:

[0249] In the embodiment depicted in Figures 19-20A-B 48-49A-B and detailed in Figure 21 20, the contact element 1914 includes an annular base 1942 having a plurality of flexures 1944 extending therefrom in a polar array. The flexure 1944 includes two support elements 2102 extending from the base 1942 to a distal end 2108. The support elements 2102 are coupled by a plurality of rungs 2104 to define apertures 2110 that facilitate flow past the contact element 1916 with little pressure drop as discussed further below. A contact pad 2106 adapted to contact the ball 1906 couples the support elements 2102 at the distal end 2108 of each flexure 1944. The flexure 1944 is generally fabricated from a resilient and conductive material suitable for use with process chemistries. In one embodiment, the flexure 1944 is fabricated from gold plated beryllium copper.

[0250] Returning to Figures 19-20B 48-49B, the clamp bushing 1916 includes a flared head 1924 having a threaded post 1922 extending therefrom. The clamp busing may be fabricated from either a dielectric or conductive material, and in one embodiment, is fabricated from the same material as the housing 1902. The flared head 1924 maintains the flexures 1944 at an acute angle relative to the centerline of the ball assembly 1900 so that the contact pads 2106 of the contact elements 1914 are

positioned to spread around the surface of the ball 1906 to prevent bending, binding and/or damage to the flexures 1944 during assembly of the ball assembly 1900 and through the range of motion of the ball 1906.

Please replace paragraphs [0253] – [0257] with the following amended paragraphs:

[0253] The boss 1934 is received in the second end 1910 of the housing 1902 and provides a surface for clamping the contact element 1914 thereto. The boss 1934 additionally includes at least one threaded hole 2006 disposed on the side of the boss 1934 that engages a fastener 2002 disposed through a hole 2004 formed in the housing 1902, thereby securing the housing 1902 to the adapter 1904 and capturing the ball 1906 therein. In the embodiment depicted in Figure 20A 49A, three fasteners are shown for coupling the housing 1902 to the adapter 1904 through counter-sunk holes 2004. It is contemplated that the housing 1902 and adapter 1904 may be fastened by alternative methods or devices, such as staking, adhering, bonding, press fit, dowel pins, spring pins, rivets and retaining rings, among others.

[0254] The ball 1904 is generally actuated towards the polishing surface 1906 by at least one of spring, buoyant or flow forces. In the embodiment depicted in Figure 19 48, the passages 1936, 1918 formed through the adapter 1904 and clamp busing 1916 are coupled through the platen 1950 to an electrolyte source 1970. The electrolyte source 1970 provides electrolyte through the passages 1936 and 1918 into the interior of the hollow housing 1902. The electrolyte exits the housing 1902 between the seat 1926 and ball 1906, thus causing the ball 1906 to be biased toward the polishing surface 1964 and into contact with the substrate 114 during processing.

[0255] So that the force upon the ball 1906 is consistent across the different elevations of the ball 1906 within the housing 1906, a relief or groove 1928 is formed in the interior wall of the housing 1906 to accept the distal ends (2108 in Figure 21 20) of the flexures 1944 to prevent restricting the flow of electrolyte passing the ball 1908. An end of the groove 1928 disposed away from the seat 1926 is generally configured to

being at or below the diameter of the ball 1906 when the ball 1906 is in the lowered position.

[0256] Figures 22-24 24-23 are perspective and sectional views of another embodiment of a conductive article having another embodiment of a ball assembly.

[0257] Figure 22 24 is a perspective view of another embodiment of an ECMP station 2290 and Figures 23-24 22-23 are perspective and partial sectional views of a ball assembly 2200 of the ECMP station 2290 of Figure 22 24. The ECMP station 2290 includes a platen 2250 that supports a polishing pad assembly 2260 (partially shown in Figure 22 24). The platen 2250 includes at least one ball assembly 2200 projecting therefrom and coupled to a power source 1972. The ball assembly 2200 is adapted to electrically bias a surface of the substrate 114 (shown in Figure 24 23) during processing. Although one ball assembly 2200 is shown coupled to the center of the platen 2250 in Figure 22 24, any number of ball assemblies may be utilized and may be distributed in any number of configurations relative to the centerline of the platen 2250.
